UHRIG - QUICK LOCK

QUICK  **LOCK**

UHRIG

The Quick Lock system, is the only short length rehabilitation system which is infinitely variable and works on the basis of compression.

Quick-Lock is a CIPP system for partial rehabilitation on the basis of compression.

Developed 20 years ago by Uhrig Kanaltechnik, the system has provide more than 80.000 sleeves to the CIPP industry. The simple displacement procedure and the little pre-treatment are the basis for a qualitative service.

The newly developed Quick-Lock liner end sleeve is a system for connecting CIPP liners to pipes and structures. The ring space between the liner and the old pipe is permanently sealed and the liner end is protected against the mechanical influences of high pressure cleaning. This is suitable for DN150 – DN1400.

The procedure is internationally recognized and approved and is used in the nominal widths of DN150 to DN 800 mm and in accessible sewers of DN 800 - DN 2.000. The matieral that is used is V4A stainless steel (1.4404) and EPDM-rubber. These have been proven in the pipeline and sewage works industry for decades.
